

## APPENDIX TO

## AZIMUTHAL ANISOTROPY OF RECEIVER FUNCTIONS IN THE CENTRAL SOUTH CHINA BLOCK AND ITS TECTONIC IMPLICATIONS

Yutao Shi<sup>1</sup>, Yuan Gao<sup>1</sup>, Ziqi Zhang<sup>2</sup>, Yongqian Zhang<sup>3</sup>, Guohui Li<sup>1</sup><sup>1</sup> Key Laboratory of Earthquake Prediction, Institute of Earthquake Forecasting, China Earthquake Administration, Beijing, 100036, China<sup>2</sup> Department of Earth and Environmental Sciences, University of Rochester, Rochester, NY, USA<sup>3</sup> China Deep Exploration Center-SinoProbe Center, China Geological Survey & Chinese Academy of Geological Sciences, Beijing 100037, China**Table S1.** Measured crustal thickness and Vp/Vs ratio by the h-k-stacking of the receiver function beneath each station in the study region. The first three columns are the station name, latitude, and longitude of the station; the fourth and fifth column indicates the crustal thickness average and Vp/Vs ratio in the crust.

**Table S2.** Estimated fast polarization direction and splitting time beneath each station in the study region. The first three columns are the station name, latitude, and longitude of the station; the fourth shows the event number; the fifth and sixth column indicates the fast polarization orientation (clockwise from north) and the standard deviation of the fast orientation; the seventh and eighth column indicates splitting time (s) and the standard deviation of the splitting time.

Station	Lat. (°)	Lon. (°)	No. RFs	Polarization (°)	SD of the Polarization	Splitting time (s)	SD of the Splitting Time
